

iC-MJ

LOW-POWER HALL SENSOR

FEATURES

- ◆ Hall sensor for absolute evaluation of magnetic field strength
- ◆ Pulsed cyclic measurements (interrupted), permanently, or triggered
- ◆ Sensitivity adjustable in two stages
- ◆ Digital measurement value output in three conditions: field strength is positive, negative or close to zero
- ◆ Very short measurement time < 30 μ s
- ◆ Very small power consumption (< 45 μ A in pulse mode)
- ◆ Wide operating voltage range of 2.3 ... 5.5 V
- ◆ Extended temperature range from -40 to +125 $^{\circ}$ C

APPLICATIONS

- ◆ Position sensors
- ◆ Battery-operated revolution counters
- ◆ Safety-related controls

PACKAGES

DFN8
3 mm x 3 mm x 0.9 mm
RoHS compliant

BLOCK DIAGRAM

iC-MJ

LOW-POWER HALL SENSOR

DESCRIPTION

iC-MJ is a magnetic field sensor for determining the absolute field strength. The output proceeds in three conditions: positive, negative, or below the switching threshold which is adjustable for high and low sensitivity.

By applying the supply voltage, an initial measurement is running after a short start-up phase (regardless of the selected mode), which results will be displayed at the outputs OUT1 and OUT2 after no more than 30 μ s.

This is followed by an energy-saving rest period when only the outputs and the internal timing generator remain active.

After the rest period, a new measurement is performed and the outputs adjusted to the result. This process is repeated as long as the supply voltage is supplied.

The automatic process can be switched: the field strength measurement can proceed either permanently, i.e. without rest period, or individually triggered by an external trigger pulse.

The switching hysteresis is depending on the latest initial state. Depending on that, successive measurements are evaluated.

PACKAGING INFORMATION DFN8-3x3

PIN CONFIGURATION

PIN FUNCTIONS

No.	Name	Function
1	ENTEST	Start test mode
2	MODE1	Measurement mode internal/triggered
3	VP	2.3... 5.5 V supply voltage
4	OUT1	Output 1
5	OUT2	Output 2
6	GND	Ground
7	GAIN	Sensitivity adjustment
8	MODE2	Measurement mode pulsed/continuous, trigger input
	BP ¹⁾	Backside paddle

Orientation of IC top marking subject to changes: <P-CODE> = product code, <A-CODE> = assembly code;

1) Connecting the backside paddle is recommended by a single link to GND.

iC-MJ

LOW-POWER HALL SENSOR

PACKAGE DIMENSIONS

All dimensions given in mm.

RECOMMENDED PCB-FOOTPRINT

All dimensions given in mm. Tolerances of form and position according to JEDEC MO-229.

Tolerance of sensor pattern: $\pm 0.10\text{mm}$ / $\pm 1^\circ$ (with respect to center of backside pad). drb_dfn8-3x3-2_mj_u_pack_1, 10:1

ABSOLUTE MAXIMUM RATINGS

Beyond these values damage may occur; device operation is not guaranteed.

Item No.	Symbol	Parameter	Conditions	Limits		Unit
				Min.	Max.	
G001	VP	Voltage at VP		-0.4	6	V
G002	V()	Voltage at OUTx, GAIN, MODEx	$V() \leq VP$	-0.4	6	V
G003	V(ENTEST)	Voltage at ENTEST		-0.4	6	V
G004	I()	Current in OUTx, GAIN, MODEx		-30	30	mA
G005	I(ENTEST)	Current in ENTEST, GAIN, MODEx		-1	1	mA
G006	Ilu()	Pulse current to all pins (Latch-Up immunity)	according to Jedec standard No.78; Ta = 25 °C, Pulswidth up to 10 ms, VP = VP _{max} , Vlu() = (-0.5...+1.5) x Vpin() _{max}	-100	100	mA
G007	Vd()	Susceptibility to ESD at all pins	HBM 100 pF discharged through 1.5 kΩ		2	kV
G008	Tj	Junction Temperature		-40	150	°C
G009	Ts	Storage Temperature Range		-40	150	°C

THERMAL DATA

Operating Conditions: VP = 2.3... 5.5V

Item No.	Symbol	Parameter	Conditions	Limits			Unit
				Min.	Typ.	Max.	
T01	Ta	Operating Ambient Temperature Range		-40		125	°C
T02	Rthja	Thermal Resistance Chip/Ambient	surface mounted, thermal pad soldered to ca. 2 cm ² heat sink		30		K/W

All voltages are referenced to ground unless otherwise stated.

All currents flowing into the device pins are positive; all currents flowing out of the device pins are negative.

506	t _{PULS}	pulse width	triggered mode	1			µs

Description of Functions

Measurement process

After the operating voltage on VP exceeded the value $V()_{ON}$, the first measurement is implemented, regardless of the selected operation mode. Further performances of iC-MJ is depending on the operation mode, which is selected by the circuitry of MODE(1,2), as described in table 4.

MODE1	MODE2	Function
0	0	pulsed
0	1	continuous
1	1 → 0	triggered: falling edge triggers measurement

Table 4: Different operating modes

At the outputs OUT(1,2), iC-MJ displays the result of the last magnetic field measurement. The outputs are retained even during the rest periods ("SLEEP" or "WAIT"). In pulsed and continuous operation, the switching thresholds and hysteresis of the current measurement are defined by the latest measurement values, so that they are subject to one coherent assessment.

A positive field means that the chip surface directs to a magnetic South Pole and the bottom to a North Pole. Thus, in this case, the field lines prevade the Hall sensor from bottom to top.

The condition $OUT(2:1) = 00$ is assigned from power-up until the completion of the first measurement (after t_{RDY}), then the outputs enter the condition of the appropriate magnetic field measurement, see table 5. A transition from 01 to 10 or vice versa thereby proceeds always via condition 11. If the supply voltage at VP falls below the threshold value $V()_{STBY}$, no further measurements are made. If the supply voltage at VP falls below the threshold value $V()_{OFF}$, iC-MJ is reset internally and the outputs are switched to $OUT(2:1) = 00$. Table 6 shows the performances of the iC-MJ at various operating voltages at VP.

OUT1	OUT2	Meaning
0	0	VP too small or start-up phase
0	1	positive field
1	0	negative field
1	1	no field

Table 5: Possible output values

VP	OUT(1:2)	Zustand
$VP < 1,2V$	00	OFF
$1,2V < VP < 2,3V$	00 oder last value	no measurement, standby
$VP > 2,3V$	01, 10 oder 11	measurement

Table 6: Performance with different operating voltages VP

The switching thresholds of the internal comparators can be determined via pin GAIN. If GAIN = 0 V, the switching thresholds are high: the magnetic field must be larger than in the more sensitive mode when GAIN is assigned to VP whereby the switching thresholds are reduced and the comparators switch even at smaller magnetic fields. Figure 1 shows the performance of the outputs in relation to the magnetic field, the switching points, and hysteresis (dashed lines). The performance for both GAIN settings is the equal.

Figure 1: Switching outputs

Pulsed operation

If the pins MODE1 and MODE2 are assigned to GND, a power-saving rest period "SLEEP" is launched after each measurement. Rest period and subsequent measurement are repeated within the period t_{CYCLE}.

Figure 2: Measurement process in pulsed operation

Continuous Operation

If pin MODE2 is assigned to VP and MODE1 to GND, the measurements run uninterrupted consecutively and continuously. This results in a measurement process as shown in figure 3.

Figure 3: Measurement process in continuous operation

Triggered Operation

If pin MODE1 is assigned to VP, each measurement can be triggered individually. A falling edge at MODE2 triggers a measurement process and displays the result at outputs OUT(1,2). After each measurement, iC-MJ goes to standby mode "WAIT" until the next measurement is triggered. Note that no trigger signal is evaluated within the period t_{HOLD} and no supply voltage is monitored during standby of the triggered mode.

Figure 4: Measurement process in triggered operation

At the beginning of each measurement, the value of 00 is output at OUT(1:2). If the measurement was successful, the respective measurement value is output. If the supply voltage VP was not sufficiently high during the measurement, OUT(1:2) remains on the latest value or changes to 00 (depending on the VP).

Switching from triggered mode to another operation mode during operation time is not intended.

DESIGN REVIEW: Notes on Chip Functions

iC-MJ V		
No.	Function, Parameter/Code	Description and Application Notes
1	Triggered operating condition	Current consumption temporary increased after prolonged waiting phase. The supply current will fall below the specified value given in item 107 after a waiting time of about 120 sec.
